

OntoGuard Boundary Proof Kit v4

Protected by U.S. Patent Application 19/444,521 - Track I prioritized examination granted May 2026.

Executive summary

This public-safe kit reflects OntoGuard current maturity: a semantic control plane for runtime authorization of proposed AI-driven state transitions. It shows controlled event-level/no-bind proof, strict-six offline audit packaging, and Batch DAP / Controlled Corridor Mode without claiming production L5 non-bypassability.

Single-event Decision API	ESCALATE
Release authorized	False
Release status	WITHHELD_PENDING_REVIEW
Routed to	HUMAN_REVIEW
Public route maturity label	L1+ event-governed no-bind proof
Raw route maturity level	L1_PLUS_EVENT_GOVERNED_NO_BIND_PARTIAL
Production enforcement asserted	False
Batch DAP status	BLOCK across 4 cases (1 allow / 1 block / 2 escalate)

Commercial meaning

- AI Output Risk Scan: identify risky, unsupported, review-heavy, or inadmissible outputs before release.
- Decision Authorization Proof: show what was attempted, what was withheld, why, and whether protected downstream effect formed.
- Strict-six audit credential: export buyer JSON, full-audit summary, PDFs, receipt, and manifest for offline review.
- Batch DAP: aggregate multiple governed cases into a controlled-corridor proof packet.

1. Execution Boundary + No-Bind Proof

This section shows what happened when a proposed AI output attempted to move toward downstream consequence.

Attempted movement	AI_OUTPUT_RELEASE
Control point	DIRECT_BACKEND_GOVERNANCE
Gate mode	SHADOW_MODE
Gate invoked before release	True
Decision	ESCALATE
Refused operation	AUTONOMOUS_OUTPUT_RELEASE
Authorization token issued	False
Downstream commit status	NOT_COMMITTED
Protected effect formed	False
No-bind status	NO_PROTECTED_EFFECT_FORMED
No-bind receipt hash	1834e98f539b90150d86cd52

Boundary note

This proves controlled event-level/no-bind behavior for a governed output release. It does not assert production route non-bypassability.

2. Route Maturity and Production L5 Boundary

The current public posture intentionally separates event-level no-bind proof from production L5 route completeness.

Public label	L1+ event-governed no-bind proof
Route completeness level	L1_EVENT_GOVERNED_NO_BIND_PARTIAL
Route maturity level	L1_PLUS_EVENT_GOVERNED_NO_BIND_PARTIAL
Route registered	PARTIAL_EVENT_ROUTE_ONLY
Tested	PARTIAL_PROOF_HARNESS_ONLY
Replayable	PARTIAL
Fail closed	True
Non-bypassable	NOT_ASSERTED_IN_SHADOW_MODE
Outcome accounted	PENDING_HUMAN_REVIEW_OUTCOME

What production L5 would require

- Attached customer route inventory and real downstream release endpoint.
- OntoGuard inline before the production commit seam.
- Valid authorization token required for commit.
- Missing, invalid, expired, route-mismatched, and decision-hash-mismatched tokens rejected.
- Direct bypass attempts rejected, replay records attached, route pressure tests passed, and outcome closure recorded.

3. Batch DAP / Controlled Corridor Mode

Batch DAP is a first-class controlled-corridor proof surface. It rolls up multiple governed cases into one aggregate packet while preserving per-case depth in full_audit.

Batch ID	corr_batch_e4ea21a3a007
Aggregate action	BLOCK
Case count	4
Allow / Block / Escalate	1 / 1 / 2
Release status	WITHHELD_PENDING_REVIEW
Route maturity level	L1_PLUS_EVENT_GOVERNED_NO_BIND_PARTIAL
Production enforcement asserted	False

Aggregate proof surfaces

- aggregate decision roll-up
- per-case hash references
- case snapshot pointers into full_audit
- aggregate execution-boundary trace
- aggregate no-bind summary
- telemetry digest
- semantic projection summary
- training-signal export candidates
- strict-six batch ZIP package

4. Strict-Six Offline Audit Credential

Each governed event or controlled batch can be packaged for buyer-readable and machine-readable review without rerunning OntoGuard.

buyer_portable.governance.json	Buyer-facing machine-readable proof
full_audit.governance.json	Full audit basis / public-safe summary in this kit
governance.pdf	Buyer-readable governance proof brief
governance.sellable_lite.pdf	One-page commercial proof overview
decision_receipt.json	Decision/no-bind receipt
artifact_manifest.json	Package manifest and hash basis

Current strict-six proof sources

- Single-event package: 678a7599-4cc3-4112-9818-0831673ba270.governance(2).zip contains 6 canonical files.
- Batch package: corr_batch_e4ea21a3a007.governance(2).zip contains 6 canonical files.
- This public kit provides sanitized replacements for website posting, not raw production/full-audit internals.

5. Semantic Projection, ROI, and Improvement Signals

Semantic projection is explanatory only. The authoritative Decision API outcome remains preserved.

Selected projection	ESCALATE
Decision API action	ESCALATE
Projection disagreement	True
Highest-scoring projection	ALLOW
Override performed	False
Coherent loading tier	WEAK
Release threshold met	False

Buyer-safe ROI framework

ROI mode: baseline_required; hard-dollar ROI calculated: False; buckets: Opex Takeout, Loss Prevention, Working Capital. Hard-dollar value requires buyer baselines.

Training / improvement signal boundary

review-gated export only; no live model-weight mutation or runtime fine-tuning.

Public limitation

The current public claim is controlled event-level/no-bind proof plus controlled Batch DAP. Production L5 route completeness requires customer route integration and evidence.
