

OntoGuard Boundary Proof Kit

Public Sanitized v8 - rich proof surface, implementation IP withheld

Current accepted single-event proof: 7479 PASS / 6 WARN / 0 FAIL. All hard checks passed.

1. Current boundary and representative event

OntoGuard governs whether a candidate movement may form, whether a formed movement may be authorized, and whether the exact authorized consequence may bind. The representative current event reached the authoritative decision lane and was withheld for human review.

Public fact	Current state
Decision	ESCALATE
Primary decision cause	GOVERNING_AUTHORITY_NOT_ESTABLISHED
Release	WITHHELD_PENDING_REVIEW
Routing	HUMAN_REVIEW
Protected effect	NOT FORMED
Downstream commit	NOT COMMITTED
Reason separation	Primary cause is separated from diagnostics and routing consequences

2. Pre-Transition Governing Floor

The Floor is an earlier formation question, not a second Decision API. In this representative compatibility route, the Floor is captured but not required; therefore its current-event disposition is NOT_EVALUABLE with FLOOR_NOT_REQUIRED_FOR_ROUTE while the existing formed-transition route continues to the authoritative Decision API.

Proof property	Public result
Current-event Floor required	False
Current-event Floor disposition	NOT_EVALUABLE
Current-event Floor formation lane	NOT_FORMED
Controlled required-Floor semantics	STANDING = formation eligibility only
NO_STANDING	Prevents authoritative decision invocation and records non-formation
NOT_EVALUABLE	Does not fabricate BLOCK or ESCALATE
Material change	Invalidates stale standing / requires revalidation

3. Authority, approval and evidence causality

Public fact	Current state
Authority completeness	INSUFFICIENT
Missing required authority	ROUTE_AUTHORITY, DELEGATED_AUTHORITY
Decision-driving approval requirement	PRESENT; satisfaction not established
Delegated authority	NOT_ATTACHED
Route authority	NOT_ATTACHED
Semantic constraint authority	NOT_ATTACHED
Reviewer outcome	PENDING
Buyer evidence display count	8
Mapped evidence count	7
Decision-causal evidence count	0
Causal rule	Retrieval/mapping/citation does not become governing or decision-causal authority by itself

4. Trust, uncertainty and benchmark context

Metric	Public value / meaning
Output Reliability Trust	22.84% - raw release-control trust signal
Decision-Basis Trust	65.27% - selected-action support; not a replacement decision authority
Presented Governance Trust	65.27% - presentation metric; raw decision trust preserved
Uncertainty	67% / high
Policy fit	PASS
Benchmark	18th percentile; 50 required; n=150
Benchmark boundary	Internal synthetic OntoGuard reference; not customer production data or external industry benchmark

5. R7 intent alignment and longitudinal governance

Surface	Public state
R7	COMPUTED; pre-decision=True; autonomous-ALLOW role=True
R7 threshold state	ESCALATION_THRESHOLD_EXCEEDED
Task projection preservation	COMPLETE; unresolved material facts=0
Semantic Curvature	INSUFFICIENT_HISTORY (1/3 records); non-decisioning
Governance Spectrum	INSUFFICIENT_HISTORY; one eligible current record; non-decisioning
Governed learning	Review-gated; no live model or ontology mutation
IP boundary	No model identity, embedding basis, formula, weights or numeric thresholds disclosed

6. Full Seam, handoff, consequence custody and replay

Proof surface	Public result
Current event maturity	EVENT_GOVERNED_ROUTE_COMPLETENESS_NOT_ASSERTED
Controlled fixture	PASS / L4_ROUTE_ENFORCED / all mandatory tests passed
Semantic Decision Handoff	Present; binds authoritative decision/release truth; projection only
No-bind consequence custody	NO_BIND_PROVEN
Same-condition replay	PASSED
Changed-condition replay current event	NOT_EXECUTED_WITH_REASON
Controlled changed-condition proof	Stale basis, action mutation and unknown handoff version fail closed
Production non-bypassability	NOT ASSERTED

7. Artifact integrity and operational timing

The canonical private package remains the exact six-member Decision Authorization Packet. Public files in this kit are sanitized projections and are not the canonical strict-six.

Artifact fact	Public result
Canonical strict-six	Exact six members verified; schema-valid final bytes
Buyer JSON	1,750,733 bytes
Full-audit JSON	9,754,077 bytes; semantically richer than buyer
Full PDF	749,751 bytes
Sellable-lite PDF	49,242 bytes
Receipt / manifest	Ready and resolve final handoff binding
Buyer compact -> ZIP	40.910s
Reused-report export budget	89.157s
Isolated frozen-input -> decision -> handoff latency	NOT YET PUBLISHED IN THIS ACCEPTED ARTIFACT

8. Acceptance and claim boundary

Acceptance surface	Current result
Single event	7479 PASS / 6 WARN / 0 FAIL; all hard checks passed
Latest batch	2504 PASS / 0 WARN / 1 FAIL; not asserted as clean release acceptance
Batch capability	Latest batch exercises ALLOW, BLOCK and ESCALATE with per-case proof binding
Controlled fixture	PASS / L4_ROUTE_ENFORCED
Customer-production L5	NOT ASSERTED; customer topology evidence required

Accepted current single-event limitations: semantic_curvature: INSUFFICIENT_HISTORY (accepted pilot/history limitation); governance_spectrum: INSUFFICIENT_HISTORY (accepted pilot/history limitation); delegated authority not attached; semantic constraint authority not attached; reviewer/outcome closure pending; controlled/event governance is not customer production topology

9. IP disclosure boundary

This kit intentionally preserves observable governance outcomes, statuses, counts, maturity, replay, and acceptance facts while withholding implementation mechanics. It contains no source code, source topology, local paths, raw prompts/model outputs, evidence/candidate bodies, retrieval mechanics, model/embedding identifiers, proprietary formulas/weights, numeric R7 thresholds, internal IDs/hashes, private registries, secrets, or signing material.

Public evidence binding: sha256:3bb2a0f08633df14e6d3c6d65c0fbb6b26baceba46ee1b46694956aa065f9d59
