

OntoGuard Boundary Proof

Public Sanitized v8 - concise buyer/reviewer surface

Current event: ESCALATE / WITHHELD_PENDING_REVIEW / HUMAN_REVIEW. Primary cause: GOVERNING_AUTHORITY_NOT_ESTABLISHED. No protected effect formed.

What is proved

OntoGuard separates formation standing, authoritative decision authorization, release control, consequence custody, and replay. The current event is event-governed; a bounded controlled route has a stronger Full Seam PASS. Production-wide non-bypassability is not asserted.

Area	Current public proof
Pre-Transition Floor	Captured. Controlled proof shows NO_STANDING prevents decision invocation and non-formation creates zero effect.
Authority	INSUFFICIENT; delegated and route authority are not attached; approval requirement is current-run and decision-driving.
Evidence	8 buyer-visible compact items; 7 mapped; 0 decision-causal evidence rows in the current decision.
R7	Computed before decision; required for autonomous ALLOW; current threshold state = ESCALATION_THRESHOLD_EXCEEDED
Replay	Same-condition replay PASSED; current changed-condition replay is explicitly not executed with reason.
Artifacts	Exact private strict-six verified; receipt/manifest bind final handoff.

Decision-quality context

Public metric	Value
Output Reliability Trust	22.84%
Decision-Basis Trust	65.27%
Uncertainty	67% / high
Internal reference benchmark	18th percentile / 50 required / n=150
Semantic Curvature	INSUFFICIENT_HISTORY (1/3)
Governance Spectrum	INSUFFICIENT_HISTORY
Single acceptance	7479 PASS / 6 WARN / 0 FAIL

Claim boundary: current-event and controlled evidence are not customer-production L5 proof. Reviewer/outcome closure remains pending. The latest batch is not claimed as clean release acceptance because one task-correspondence assertion remains unresolved.

IP boundary: no implementation source, raw evidence/prompts, retrieval mechanics, model/embedding identity, proprietary formulas/weights, numeric thresholds, internal IDs/hashes or private registries are disclosed.
