

OntoGuard Layer Facts

Public architecture facts - implementation details withheld

Layer	Public role
Pre-Transition Governing Floor	Determines whether a non-executable candidate may acquire standing to form an authorization-eligible transition when the route requires it.
Frozen authorization input	Carries the final pre-decision movement, governing conditions, authority, evidence and R7 state that reach the authoritative decision.
Decision API	Sole authority for ALLOW / BLOCK / ESCALATE and release truth.
Semantic Decision Handoff	Compact, versioned projection for downstream consumption; never a second decision authority.
Release / consequence control	Accounts for release authorization, no-bind, protected-effect formation and downstream commit status.
Receipt / manifest / replay	Portable proof binding and deterministic continuation/replay evidence.
Longitudinal governance	Bounded, non-decisioning portfolio intelligence plus review-gated future learning signals.

Evidence maturity

Evidence layer	Current public status
Representative event	Event governed; release withheld; no protected effect formed.
Controlled Full Seam	PASS / L4_ROUTE_ENFORCED in bounded controlled route.
Customer production	Not asserted; production topology/non-bypassability evidence still required.
Longitudinal history	Insufficient history; no fabricated trend.
Reviewer closure	Pending; no fabricated outcome.
Latest clean single acceptance	7479 / 6 / 0

OntoGuard IP is not represented by these public layer descriptions. Source implementation, retrieval mechanisms, model/embedding fingerprints, formulas, weights, internal identities and private evidence remain withheld.
